The eco-friendly innovation in digital printing and soft signage

Star rating: ColorGATE RIP software certified with top marks for the new HP Designjet L25500

ColorGATE, a participant of long standing in the international HP Designjet Certification Program, has once again raised the bar: Productionserver, the universal production RIP from the Hannover-based software development specialists, has just been certified for the brand-new HP Designjet L25500 with an outstanding rating of 21 stars and is one of the first software solutions worldwide to boast the coveted privilege of being “Certified for the HP Designjet L25500”.

Users now have the certified guarantee that, with Productionserver, they will be able to take full advantage of the complete range of functions offered by the HP Designjet L25500.

The solution scored full points for all the certification criteria: calibration (3/3), media flexibility (3/3), printer reporting (3/3) and job management (3/3); in addition, the ColorGATE production RIP has also been equipped with high-quality profiles for the modern HP media, including the recyclable signage media of HP heavy textile banner / HP light textile banner, HP HDPE reinforced banner, HP photo-realistic poster paper as well as HP white satin poster paper – this led to another 3 of a possible 3 stars for the criterion of HP Media Support. HP has published the current [star rating for the ColorGATE Productionserver](#).

Better ranking as international competitor

In contrast to the international competition, the ColorGATE solution was also able to claim the maximum number of points in two further areas of the HP certification process. Tested for printing performance, for example, Productionserver proved that it is able to support the new HP concept of *concatenating*, which provides for optimum throughput for job processing by automatically sorting and grouping the jobs according to the print settings; this reduces the switch from cooling to new heating phases to a minimum. 3 of 3 stars were also awarded for the complete integration of HP Professional PANTONE® Emulation (HP PPE). “The exact reproduction of PANTONE® colors always presents an exacting challenge, in the field of advertising in particular,” commented ColorGATE Managing Director Thomas Kirschner. “The use of the HP Designjet L25500 in combination with the HP PPE-enabled Productionserver allows reproduction results that clearly surpass all the alternative methods currently available on the market – and that is possible even without the installation of special libraries. The results: top-quality, more productively and simply than ever before!”

HP Designjet L25500

The outstanding features of the new HP Designjet L25500 include the unrivaled application range both outdoors and in, which, in comparable quality, by far outdoes what conventional eco-solvent and water-based printing systems have to offer. The integrated spectrophotometer and the proprietary HP Optical Media Advance Sensor (OMAS) provide for high productivity and optimal image quality; both of these measuring instruments are supported by Productionserver.

The water-based HP latex inks are completely hardened in the HP Designjet L25500 and produce odorless prints, which, thanks to their durability, are ideal for displays and other demanding indoor applications.

“We are very happy that we are able to support an eco-friendly solution with our feature-rich production RIP right from the day of its market introduction in an area of application that used to be restricted exclusively to the solvent segment,” Thomas Kirschner pointed out.

Special editions for quick decision-makers

On the release of Productionserver Version 6, ColorGATE now presents two editions that have been customized for use with the new HP printing system: the PS 6 HP L25500 Best-Price Edition includes Productionserver 6 Pro with 1 queue, 1 RIP process and 1 printer driver; the PS 6 HP L25500 Producer Edition is additionally equipped with another RIP process for optimal capacity utilization along with an integrated profiling solution. It also features *Ink Saver*, a new ColorGATE technology that uses GCR-optimized DeviceLink profiling to reduce ink costs by up to 30 percent. Both editions are now on offer at an attractive price – “the price/performance ratio is simply phenomenal,” continued Thomas Kirschner. “That should make it very, very easy for all interested users to make a quick decision.”

Productionsserver – an award-winning solution

Productionsserver, named as the best software solution in the field of “RIP Solutions for Wide Format” by the European Press Association for Digital Printing (EDP), is impressive in its speed, its quality and its production reliability. The platform-independent solution is modular in design and can be expanded to include all applications in large-format printing, including film production and proofing, print-and-cut and photo and fine art.

A total of five profiling modules are available for individual profiling directly from the application; the Media Device Synchronization (MDS) and Quality Assurance (QAM) modules ensure fully integrated quality assurance technology when used for LFP production.

The HP Designjet Certification Program

[The HP Designjet Certification Program](#) ensures that users can depend on the compatibility and integration of the certified RIP and workflow solutions provided by leading suppliers with the corresponding hardware systems from HP. The coveted certification is awarded exclusively to those products that have been rigorously tested on the basis of the criteria stipulated by HP and that have achieved the required test results.

About ColorGATE

ColorGATE Digital Output Solution GmbH, with its main offices in Hannover, the capital city of Lower Saxony, Germany, is an internationally active supplier of innovative product, consulting and system solutions for printing services and color management. The owner-operated company, which was founded in 1997, maintains locations in Germany, Italy and UK.
